Interest over time ?

☒ News headlines ? ☐ Forecast ?

Web components merupakan standard w3c yang merupakan gabungan dari beberapa low-level API.

Template

native client-side templating

Shadow DOM

scoping, composition

Custom Elements

define new HTML/DOM

HTML Imports

loading web components

API Web components sudah di desain agar kita dapat membuat **library di atas standar yang sudah ada.**

So what is Polymer?

**Polymer is not
a framework**

The diagram illustrates the layers of web architecture. It consists of four horizontal layers. The top layer, 'Applications', is composed of eight teal rounded rectangles. The second layer, 'Existing Frameworks', is a single wide teal rounded rectangle. The third layer, 'Web Components built with Polymer (or not)', is composed of eight magenta rounded rectangles. The bottom layer, 'Web Platform', is a single wide teal rounded rectangle. The text is white and centered within each layer.

Applications

Existing Frameworks

Web Components built with Polymer (or not)

Web Platform

Is it **ready**?

[LEARN MORE](#)

The background features three large, overlapping geometric shapes. On the left is a blue structure composed of several triangles and rectangles, some with lighter blue highlights. In the center is a pink structure, also made of geometric facets, with some darker pink shading. On the right is a purple structure, similarly faceted, with some darker purple highlights. Below the blue structure is a small, solid dark blue circle.

**READY FOR
PRODUCTION**

Let's build
an element!

element-baru.html

```
<link rel="import" href="../../polymer/polymer.html">
<dom-module id="element-baru">
  <template>
  </template>
  <script>
    Polymer({
      is: 'element-baru'
    });
  </script>
</dom-module>
```

element-baru.html

```
<link rel="import" href="../../polymer/polymer.html">
```

```
<dom-module id="element-baru">
```

```
  <template>
```

```
</template>
```

```
  <script>
```

```
    Polymer({
```

```
      is: 'element-baru'
```

```
    });
```

```
</script>
```

```
</dom-module>
```

**Import all of your
dependencies.
HTML Imports**

element-baru.html

```
<link rel="import" href="../../polymer/polymer.html">
```

```
<dom-module id="element-baru">
```

```
  <template>
```

```
</template>
```

```
<script>
```

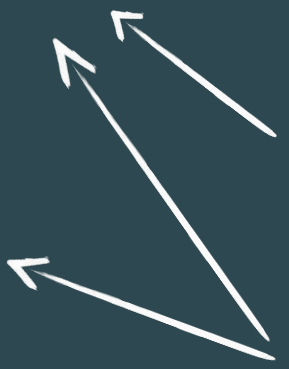

```
  Polymer({
```

```
    is: 'element-baru'
```

```
  });
```

```
</script>
```

```
</dom-module>
```

A container for your
element definition.
Custom Element

element-baru.html

```
<link rel="import" href="../../polymer/polymer.html">
```

```
<dom-module id="alert-banner">
```

```
  <template>
```

```
  </template>
```

```
  <script>
```

```
    Polymer({
```

```
      is: 'alert-banner'
```

```
    });
```

```
  </script>
```

```
</dom-module>
```

Local DOM is the DOM
an elements is *in charge of*
creating and managing.
Template and Shadow DOM
